✕ Questions to Review

Q19. Which α value would you most likely try **FIRST** when implementing gradient descent?

Your answer: D. Always exactly 1.0

✓ Correct: C. 0.01 or 0.1

Typical starting values are 0.001, 0.01, or 0.1. You then monitor J vs. iterations: if it oscillates, reduce α; if it's too slow, increase α. Grid search or learning rate schedules help find the best value.
